# Day 17 – Cross-Browser Testing & Responsive Testing

## 1. Cross-Browser Testing

**Definition:** Cross-Browser Testing is a testing approach where we test the same application on different browsers to check whether it works properly on all of them.

**Simple Explanation:** We open the same application in different browsers and check its appearance, layout and functionality.

**Example: The Internet (Herokuapp) – Login Functionality**

Suppose we get The Internet (Herokuapp) website for testing. We need to test its Login functionality.

**What will we do?**

1. Open the website in Google Chrome.
2. Open the same website in Mozilla Firefox.
3. Open it in Opera.
4. Open it in Microsoft Edge.
5. Check whether the Login page opens properly in all browsers.
6. Check whether the Username field, Password field and Login button are displayed properly.
7. Enter the Username and Password.
8. Click the Login button.
9. Check whether Login works properly in each browser.
10. Report any browser-related issue found.

**Conclusion:** We test the same application on different browsers to check its appearance and functionality. This is called Cross-Browser Testing.

**Remember:** Same Application + Different Browsers = Cross-Browser Testing.

## 2. Responsive Testing

**Definition:** Responsive Testing is a testing approach where we check how an application looks and behaves on different screen sizes.

**Simple Explanation:** We open the same application on different screen sizes, such as Desktop, Tablet and Mobile. We check whether the layout adjusts properly and the functionality works correctly.

**Example: The Internet (Herokuapp) – Login Functionality**

**What will we do?**

1. Open the website on a Desktop or Laptop.
2. Open the same website on a Tablet.
3. Open it on a Mobile phone.
4. Check whether the layout adjusts according to each screen size.
5. Check whether the Username field, Password field and Login button are displayed properly.
6. Check whether text, images and buttons are visible and usable.
7. Check whether unnecessary horizontal scrolling appears.
8. Enter the Username and Password.
9. Click the Login button.
10. Check whether Login works properly on all screen sizes.

**Conclusion:** We check whether the application adjusts properly to different screen sizes and works correctly on each device. This is called Responsive Testing.

**Remember:** Same Application + Different Screen Sizes = Responsive Testing.

## 3. Difference Between Cross-Browser and Responsive Testing

| Cross-Browser Testing | Responsive Testing |
|---|---|
| We test on different browsers. | We test on different screen sizes. |
| Chrome, Firefox, Opera, Edge. | Desktop, Tablet, Mobile. |
| We check browser compatibility. | We check layout and responsiveness. |
| We verify appearance and functionality across browsers. | We verify layout and functionality across screen sizes. |

## 4. Quick Revision

**Cross-Browser Testing:** Testing the same application on different browsers to check its appearance and functionality.

**Responsive Testing:** Testing the same application on different screen sizes to check its layout and functionality.

**Important:** Cross-Browser Testing focuses on different browsers. Responsive Testing focuses on different screen sizes. In both approaches, we also verify that important user flows work correctly.
